

TUNEL VPN

Un túnel es una ruta alternativa que permite llegar de un router a otro encapsulando los datos. La función habitual es encriptar datos para que no sean visibles. Otras razones que justifiquen el túnel, puede ser para ofrecer calidad de servicio.

Para crear debemos definir los interfaces sobre los que se habilitará.

El origen del túnel, será la salida del router origen.

El destino del túnel, será la entrada del router destino.

El túnel tendrá dos ip, una en cada interface

Pasos para crear el túnel:

1º) Definimos el túnel:

```
interface Tunnel0
```

```
ip address origen_del_tunel mascara
```

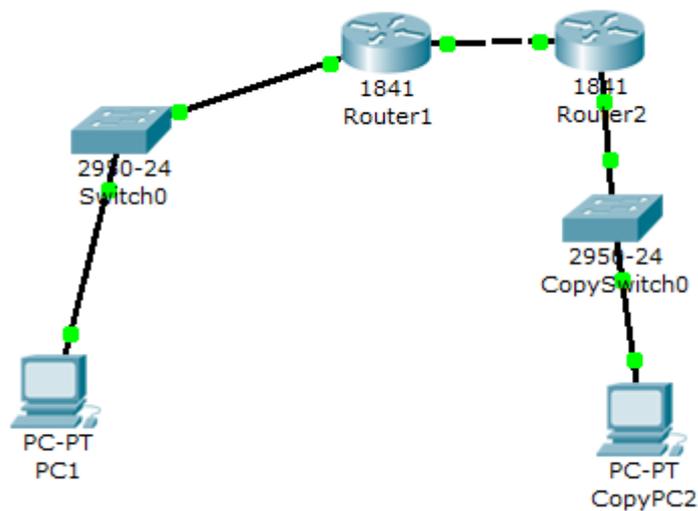

```
tunnel source interface_salida_router (el origen del túnel es el interface de salida del router)
```

```
tunnel destination ip_destino (salida del túnel, ip del interface destino en router destino)
```

2º)Asignamos una ruta estática que ofrezca el camino a través del túnel.

```
ip route red_destino mascar ip_tunel_otro_router
```
